**FOR IMMEDIATE RELEASE**

### **DCHHS reports the seventh human case of West Nile Virus**

**DALLAS (August 19, 2021)** – Dallas County Health and Human Services (DCHHS) reports the seventh human case of West Nile Virus (WNV) infection in Dallas County for 2021. The patient is a resident of the 75204 zip code in Dallas and was diagnosed with West Nile Neuroinvasive Disease (WNND). Due to privacy and confidentiality reasons, DCHHS does not disclose personal information on the patient.

DCHHS has reported one West Nile Virus related death for 2021 compared to six WNV related deaths for 2020 and one WNV related death in 2019. Two of the seven human cases of WNV reported in 2021 are in females and five are in males.

“We are very sorry to be reporting the seventh case of the West Nile Virus in Dallas County this year,” said Dr. Philip Huang, DCHHS Director. It is hard to imagine that these illnesses can result from something as seemingly minor as a mosquito bite. Please follow the 4 D’s to do everything you can to avoid mosquito bites.”

- **DEET:** Whenever you’re outside, use insect repellents that contain DEET or other EPA-approved repellents and follow instructions.
- **DRESS:** Wear long, loose, and light-colored clothing when outdoors.
- **DRAIN:** Drain or treat all standing water in and around your home or workplace where mosquitoes could lay eggs.
- **DAWN to DUSK:** Limit your time outdoors during these times when mosquitos are most active.

WNV is a disease that is spread by the bite of an infected mosquito. Mosquitoes can become infected when they feed on the blood from infected birds. The infected mosquitoes can then transmit WNV to humans and animals. Severe WNV infections can cause neurologic complications such as encephalitis. Milder symptoms include fever, headache, and muscle aches. There is no vaccine or specific treatment for WNV. For more information, visit our website:
