FOR IMMEDIATE RELEASE

DCHHS Reports Two New Human Cases of West Nile Virus

DALLAS (July 27, 2023) – Dallas County Health and Human Services (DCHHS) reports two new human cases of West Nile Virus (WNV) infection in Dallas County for 2023. There are four total human cases thus far. The patients are two male residents of the 75228 and 75204 zip codes in the City of Dallas.

Both patients were diagnosed with West Nile Neuroinvasive Disease (WNND.) Due to privacy and confidentiality reasons, DCHHS does not disclose additional information about the patient.

“Mosquito activity continues in our community, and we’re now reporting two additional human cases of West Nile Virus. WNV is transmitted to humans by the bite of an infected mosquito, and people should be careful when going out outside to enjoy outdoor activities,” said Dr. Philip Huang, DCHHS Director. “Please follow the 4 Ds to do everything you can to avoid mosquito bites.”

- **DEET:** Whenever you’re outside, use insect repellents that contain DEET or other EPA-approved repellents and follow instructions.
- **DRESS:** Wear long, loose, and light-colored clothing when outdoors.
- **DRAIN:** Drain or treat all standing water in and around your home or workplace where mosquitoes could lay eggs.
- **DAWN to DUSK:** Limit your time outdoors during these times when mosquitos are most active.

WNV is a disease that is spread by the bite of an infected mosquito. Mosquitoes can become infected when they feed on the blood of infected birds. The infected mosquitoes can then transmit WNV to humans and animals. Severe WNV infections can cause neurologic complications such as encephalitis. Milder symptoms include fever, headache, and muscle aches. There is no vaccine or specific treatment for WNV. For more information, visit our website:
