Ending the Epidemic in Texas

Texas Department of State Health Services
TB/HIV/STD Section
**Data Sources**
The data contained in this report is compiled by the Texas Department of State Health Services; HIV/STD Branch.

Data sources include: Enhanced HIV AIDS Reporting System (as of July 2019), Medicaid, ARIES (Ryan White Program database), ADAP (AIDS Drug Assistance Program), STD*MIS (Prevention and Public Health Follow Up database), the Texas Medical Monitoring Project and private insurance data.

**Terminology & Abbreviations**

PLWH—People Living With HIV

HSDA—HIV Service Delivery Area (based on HIV Care & Treatment funding)

Mode of Exposure—How a person acquired HIV—a person’s biological sex (i.e. sex assigned at birth) is used to determine mode of exposure

- **Male-Male Sexual Contact**—HIV acquisition most likely occurred due to sexual contact between two men
- **Injection Drug Use**—HIV acquisition most likely occurred due to injection drug use
- **Male-Female Sexual Contact**—HIV acquisition most likely occurred due to sexual contact between a man and a woman.

Priority Populations—Populations who are disparately and disproportionately impacted by HIV

Latinx—a gender neutral term used in place of Latino or Latina

Latinx MSM—Latinx gay, bisexual and other cisgender Men who have Sex with Men

White MSM—White gay, bisexual and other cisgender Men who have Sex with Men

Black MSM—Black gay, bisexual and other cisgender Men who have Sex with Men

Black Women—Black cisgender Women who have sex with men

Transgender People—includes both transgender men and transgender women. A significant majority of Transgender PLWH are transgender women.

Latinx Women—Latinx cisgender Women who have sex with men

PWID—People Who Inject Drugs

PrEP—Pre-Exposure Prophylaxis—HIV Prevention Medication

nPEP—non-occupational Post-Exposure Prophylaxis

Behavioral Interventions—interventions designed to change behaviors that make people more vulnerable to acquiring HIV. These can include individual, group and community level interventions.

Retention in Care—2 contacts with the care system, at least 3 months apart in the calendar year (contacts include a visit with a medical provider, HIV lab work, or and ART prescription)

Viral Suppression—a viral load <= 200 copies/ml

In-Care Viral Suppression—Viral Suppression among PLWH who have achieved Retention in Care
People Living With HIV (PLWH) and New HIV Diagnoses

In the Dallas HSDA, the number of new HIV diagnoses has remained flat and stable for the past several years.

There were 22,999 people living with HIV (PLWH) in this area as of the end of 2018. In 2018, 1,027 people were newly diagnosed with HIV. This includes only people with diagnosed HIV with a current address in this area. People with undiagnosed HIV are not included.

Priority Populations (76% of PLWH, 79% of New HIV Diagnoses)

Priority populations make up the majority of PLWH and the majority of new diagnoses. White MSM and Black MSM are the largest priority populations among PLWH and Black MSM are the largest priority population among new HIV diagnoses.
Gender
Males make up the majority of PLWH and the majority of new HIV diagnoses.

*Note*
Due to current reporting methods, the number of transgender PLWH are most likely underreported.

Mode of Exposure
Male-Male Sexual Contact makes up the primary mode of acquisition among PLWH and among new diagnoses.

Age
The majority of PLWH is split between ages 25-45 and 45-64; the majority of new diagnoses are among people 25-45.

Race/Ethnicity
The majority of PLWH and the majority of new diagnoses are among Black individuals.
**Focused Prevention**

Focused Prevention involves ensuring that HIV prevention efforts are centered around those populations and communities where HIV is most heavily concentrated. These populations are often disparately impacted by HIV and any efforts to significantly reduce new HIV incidence must focus on meeting the needs of these groups. Focused Prevention interventions are based on the concept of Combination Prevention. Combination Prevention values client autonomy and includes Behavioral Interventions, Condoms/Lubricant, HIV/STI Testing, and Biomedical Interventions like PrEP, nPEP and Treatment as Prevention (TasP).

*Texas’ goal is that all people with increased vulnerabilities to acquiring HIV have equitable access to Combination Prevention.*

**Locally Relevant Populations for Prevention**

*In the Dallas HSDA, HIV prevention efforts should be centered around these populations:*

- Latinx MSM
- White MSM
- Black MSM
- Black Women
- Transgender People
- Latinx Women
- PWID

**Local Prevention Interventions—DSHS Funded** *(see Appendix A for intervention descriptions)*

- *Routine HIV Screening in Health Care Settings*
- *Core HIV Prevention*
- *PrEP and nPEP*
- *Client Level Interventions - Many Men, Many Voices; Behavioral Health, Connect*
- *Structural Intervention—MPowerment, Community PROMISE*
**FULL DIAGNOSIS**

*Texas’ goal is that 90% of all PLWH know their status by 2030.*

**Primary Diagnosing Facilities 2013-2018**

36% of HIV diagnoses in the Dallas HSDA happen in these 5 facilities. Parkland Hospital is the top diagnosing facility in the area.

**Late Diagnosis 2014—2017**

A “late diagnosis” is when a person receives a Stage 3/AIDS diagnosis within 3 months of their initial HIV diagnosis. Studies have linked late HIV diagnoses to slower CD4 gains, faster disease progression and higher mortality.

Late diagnoses among Black Women have been decreasing over the past few years.

* 2017 is the most recently available year for late diagnosis data
**Successful Linkage**

We know that treatment for HIV keeps PLWH healthier longer and reduces deaths, but it is most effective if treatment starts soon after the diagnosis is made. Linkage refers to the time it takes from the person’s diagnosis to when they have their first episode of HIV medical care.

*Texas’ goal is for 90% of all people newly diagnosed with HIV to be linked to care within 3 months.*

**Timely Linkage—2018**

79% of people diagnosed with HIV in the Dallas HSDA in 2018 were linked to care within 3 months.

**Timely Linkage—Priority Populations—2012-2018**

*Coming Soon*
Retention in Care and Viral Suppression are two key measures that help us understand individual level health, efficacy of HIV care systems, and Community Viral Load. Retention in Care is defined as at least 2 contacts with the care system during the year (either an HIV medical appointment, HIV lab work, or an ART prescription). Viral Suppression is defined as a viral load that’s less than/equal to 200 copies/ml. For these purposes we’re looking at the last viral load of the year.

Studies have shown that PLWH who are able to maintain viral suppression (for at least 6 months) can not transmit HIV.

Health Outcomes—Stoplight System

Texas’ goals by 2030 are:

- 90% PLWH retained in HIV care & treatment
- 90% of those retained achieve viral suppression

Communities and populations are prioritized using the following color coding system:

- On ART / Retention In Care
  - < 69%
    - Stop and examine further, May be a priority
  - 70% - 89%
    - May need to examine further, May not be a priority
  - 90% <
    - Maintain Current Activities, Look for Promising Practices

- On ART/In-Care Viral Suppression
  - < 84%
  - 85% - 89%
  - 90% <
In the Dallas HSDA, 73% of PLWH have achieved retention in care, 64% of total PLWH have achieved viral suppression, and 88% of PLWH who are retained in care achieved viral suppression.

Retention in care is a priority for the overall Dallas HSDA.
### 2018 Continuum of Care, Parity Table

The communities with the fewest opportunities to achieve retention in care are people under the age of 45 and Black PLWH, specifically Black MSM.

The communities with the fewest opportunities to achieve viral suppression even when retained in care are people under the age of 25, PWID, Transgender PLWH, and Black PLWH, specifically Black MSM.

People over the age of 45, Latinx MSM and White PLWH, specifically White MSM have achieved In-Care Viral Suppression goals.

#### PLWH retained in HIV care & treatment

90% of those retained achieve viral suppression

Appendix A: Prevention Interventions

The following are brief overviews of DSHS funded HIV prevention activities. With the exception of Routine HIV Screening in Health Care Settings, all prevention activities are focused on populations who have increased vulnerabilities to acquiring HIV. See the Focused Prevention section for locally relevant populations who are appropriate for Focused Prevention activities.

Routine Screening in Health Care Settings

The CDC recommends that everyone between the ages of 13 and 64 get tested for HIV at least once as part of routine health care and those with increased vulnerabilities to HIV (including gay, bisexual and other men who have sex with men) get tested more frequently. DSHS funded Routine Screening programs are opt-out testing programs and can be found in a variety of facilities, including hospital emergency departments, community health centers, and jail medical services.

Activities conducted in Routine Screening programs must include:

- Routine HIV screening and notification of HIV-positive results; and
- Linkage to and engagement in HIV medical care for people with HIV-positive test results

More information on evidence-based linkage programs can be found at the CDC in the Compendium of Evidenced-Based Intervention and Best Practices for HIV Prevention

Core HIV Prevention

Core HIV Prevention programs must include the following activities:

- Engaging populations with increased vulnerability to HIV
- Condom distribution
- Focused HIV and syphilis testing in non-clinical settings (emphasis on locations with high probability of encountering the locally relevant population for focused prevention)
- Linkage to and engagement in HIV medical care for people with HIV-positive test results; and
- Referral to PrEP, nPEP and other needed services for people with HIV-negative test results and increase vulnerabilities to acquiring HIV

More information on evidence-based linkage programs can be found at the CDC in the Compendium of Evidenced-Based Intervention and Best Practices for HIV Prevention
PrEP and nPEP

The CDC states that when taken daily, PrEP is highly effective for preventing HIV. Studies have shown that PrEP reduces the risk of getting HIV from sex by about 99% when taken daily. Among people who inject drugs, PrEP reduces the risk of getting HIV by at least 74% when taken daily.

PEP is also highly effective at preventing HIV. PEP is the use of antiretroviral drugs after a single high-risk event to stop HIV seroconversion. PEP must be started as soon as possible to be effective—and always within 72 hours of a possible exposure.

Activities conducted in PrEP and nPEP programs must include:

- Promotion and marketing of PrEP/nPEP through community education and awareness activities
- Promotion of adoption of PrEP/nPEP by local clinical providers; and
- Delivery of PrEP/nPEP clinical and client support services (this funding may not be used to pay for PrEP/nPEP medications, but it may be used for: navigation staff, clinical staff, initial and ongoing medical testing, adherence counseling and benefits counseling.

Client Level Interventions

Client Level Interventions are evidence-based or practice-based behavioral interventions delivered to individuals or groups that have shown effectiveness in preventing HIV transmission and acquisition. These interventions may be focused on both PLWH or HIV-negative people with increased vulnerabilities to acquiring HIV. Programs funded through DSHS may use approved “homegrown” interventions, or one of the CDC interventions listed in the Compendium of Evidenced-Based Intervention and Best Practices for HIV Prevention.

Currently funded interventions in Texas include:

- Healthy Relationships
- Personalized Cognitive Counseling
- CLEAR
- Many Men, Many Voices
- Behavioral Health
- Connect
- ¿ Y Ahora Que?
- VOICES/VOCES
Structural Interventions

Structural interventions are projects implemented at the community or system level in order to reduce the risk of HIV transmission and acquisition. These programs must work to reduce health inequalities, and new HIV infections by directly addressing the social determinants of health such as stigma, lack of support, or policies or organizational practices that create barriers to prevention and treatment. Activities must be centered on one or more of the outcomes below:

- Strengthening community involvement in HIV prevention efforts by increasing a sense of community ownership, participation, and collaboration in HIV prevention activities;
- Increasing local coordination and collaboration among community members, groups, organizations, and sectors (e.g., private business, public institutions);
- Increasing community support, education, and dialogue;
- Creating an environment in which people of color, LGBTQ individuals, youth, and other marginalized populations are empowered to reduce the risk of HIV acquisition and barriers to accessing HIV prevention are reduced/eliminated;
- Elimination of structural, social, and economic barriers related to healthcare;
- Improved health outcomes for LGBTQ communities and people of color; and
- Increased participation in HIV-related care and PrEP

Programs may use ‘traditional’ community-level interventions as part of their structural intervention. Programs funded through DSHS may use approved “homegrown” interventions, or one of the CDC interventions listed in the Compendium of Evidenced-Based Intervention and Best Practices for HIV Prevention, or one of the Community and Structural-level interventions found on the CDC’s Effective Interventions.

Currently funded interventions in Texas:

- MPowerment
- Stigma Reduction
- Community PROMISE
- Addressing Stigma
The Texas Department of State Health Services HIV Prevention Program awarded new five-year project period Contractors on January 1, 2020. The contracts below are for year one of the five-year project period.
